

# How to Update the Events Page

The events on your website are powered by a single spreadsheet-style file called `events.csv`. You can add, edit, or remove events at any time by editing this file directly through cPanel. No developer needed, and changes go live immediately without any rebuild.

## Step 1: Access Your File Manager

- 1. Go to [GreenGeeks](#) and log in to your account.
- 2. From your dashboard, click **cPanel**.
- 3. Inside cPanel, open **File Manager**.
- 4. Navigate to your site's `public_html` folder (or whichever folder your site lives in).
- 5. Find and open the file named `events.csv`.

## Step 2: Understand the File Format

The file looks like this when opened:

```
image,title,date,time,blurb
https://example.com/photo.jpg,Spring Kickoff Ride,April 5 2025,9:00
AM,"Shake off the winter rust with our annual spring opener."
```

Each event is **one line**, and each piece of information is separated by a comma. The first line is the header row. **Do not delete or change it.**

| Column             | What it does                       | Example                                    |
|--------------------|------------------------------------|--------------------------------------------|
| <code>image</code> | URL or path to the event photo     | <code>https://example.com/photo.jpg</code> |
| <code>title</code> | Name of the event                  | <code>Spring Kickoff Ride</code>           |
| <code>date</code>  | Date written out in plain text     | <code>April 5 2025</code>                  |
| <code>time</code>  | Time of the event                  | <code>9:00 AM</code>                       |
| <code>blurb</code> | Short description (wrap in quotes) | <code>"A fun ride for all levels."</code>  |

**Important:** If your blurb contains a comma, it must be wrapped in double quotes, e.g. `"Bring water, snacks, and your helmet."` When in doubt, always wrap the blurb in quotes.

## Step 3: Add, Edit, or Remove Events

**To add an event:** Copy any existing event line, paste it at the bottom, and fill in your new information.

**To edit an event:** Find the line for that event and change the relevant fields.

**To remove an event:** Delete the entire line for that event.

---

## Step 4: Choosing an Image

You have two options for event images.

---

### Option A: Use a Free Online Image (URL)

If you find a photo online that you want to use (and have the right to use), you can paste its direct URL into the **image** column.

1. Find your image online and copy its direct image URL (it usually ends in **.jpg**, **.png**, or **.webp**).
2. Paste that URL as the first value on your event's line.

#### Example:

```
https://upload.wikimedia.org/wikipedia/commons/photo.jpg,Trail Cleanup  
Day,May 10 2025,9:00 AM,"Help us keep the trails beautiful."
```

**Tip:** A good free source for photos is [Unsplash](#). Find a photo, right-click it, and choose "Copy image address" to get the direct URL.

---

### Option B: Upload Your Own Photo via cPanel

If you have your own photo, you can upload it to your hosting and use that instead. This keeps images under your control and they won't break if an external site goes down.

1. In cPanel File Manager, navigate to your **public\_html** folder.
2. Create a folder called **images** inside **public\_html** if one doesn't already exist (or use an existing one).
3. Click **Upload** and upload your photo file (**.jpg** or **.png** recommended).
4. Once uploaded, your image is accessible at:

```
/images/your-photo-name.jpg
```

5. Use that path as the **image** value in your CSV line.

#### Example:

```
/images/trail-cleanup.jpg,Trail Cleanup Day,May 10 2025,9:00 AM,"Help us  
keep the trails beautiful."
```

**Note:** The path starts with a forward slash / and does **not** include your domain name. Make sure the filename in the CSV matches the uploaded file exactly, including capitalization (e.g. `Trail.jpg` and `trail.jpg` are different).

---

## Step 5: Save the File

After making your changes in cPanel's file editor, click **Save Changes**. Your events page will reflect the updates immediately the next time someone visits it. No rebuild required.

---

## Quick Checklist

- ☐ Header row (`image,title,date,time,blurb`) is still the first line
- ☐ Each event is on its own single line
- ☐ Blurb is wrapped in double quotes
- ☐ No extra blank lines between events
- ☐ Image URL or path is correct and accessible
- ☐ File is saved
